**CLAIM AMENDMENTS** 

Please cancel claims 5, 12, 17, and 23 without prejudice or disclaimer.

Please amend claims 1, 6-7, 11, 13, 18-19, and 24 as follows.

1. (Currently Amended) A network, comprising:

at least one transmitting device and at least one receiving device; and

a bus coupled to between the devices to exchange frames, wherein each frame

is to include[[s]] a data structure, at least one control structure, and a clock structure, and

wherein a rising edge of each frame is to indicate[[s]] the clock structure and a falling edge

of each frame is to indicate[[s]] that a structure that follows the falling edge of the frame is

the data structure or the command structure, and wherein any receiving device in a set of

devices is coupled to use a clock structure to adjust each phase of one or more of the frames

to synchronize the frames with each other,

wherein the falling edge of the frame occurring at one predetermined point in

the control structure is to indicate a first command word and the falling edge of the frame

occurring at a second predetermined point in the control structure is to indicate a secondary

set of command words, and wherein the falling edge of the frame occurring at one

predetermined point in the data structure indicates a first data word and the falling edge of

the frame occurring at a second predetermined point in the data structure indicates a

secondary set of data words.

(Original) The network of claim 1 wherein the data structure comprises a 2.

predetermined number of encoded data field bits.

(Original) The network of claim 1 wherein the command structure comprises a 3.

predetermined number of encoded command/control field bits.

(Original) The network of claim 1 wherein the falling edge of the frame occurring at 4.

one predetermined point in the control structure indicates a first command and the falling

edge of the frame occurring at a second predetermined point in the control structure indicates

a secondary set of commands.

Examiner: Vaughn Jr., William C. 42P11014 Art Unit: 2143

- 2 -

5. (Canceled).

6. (Currently Amended) The network of claim 1 wherein the falling edge of the frame

occurring at one predetermined point in the control structure indicates a first command word

and the falling edge of the frame occurring at a second predetermined point in the control

structure indicates a secondary set of command words, and wherein the falling edge of the

frame occurring at one predetermined point in the data structure indicates a first data word

and the falling edge of the frame occurring at a second predetermined point in the data

structure indicates a secondary set of data words, and wherein the secondary set of command

words is greater than the secondary set of data words.

7. (Currently Amended) A method for processing data in a network, comprising:

transmitting computer data signals embodied in carrier waves from a

transmitting device to a receiving device, wherein each computer data signal is to include[[s]]

a data structure embodied in an encoded frame, at least one control structure embodied in the

encoded frame, and a clock structure embodied in the encoded frame, and wherein a rising

edge of the encoded frame is to indicate[[s]] the clock structure and a falling edge of the

frame is to indicate[[s]] whether what follows the falling edge of the frame is the data

structure or the command structure; and

receiving the computer data signals at the receiving device and using the clock

to adjust the phase of the frames to synchronize the frames with each other,

wherein transmitting computer data signals embodied in carrier waves from a

transmitting device to a receiving device comprises:

dropping the falling edge of the frame at one predetermined point in

the control structure to indicate a first command word and at a second predetermined point in

the control structure to indicate a secondary set of command words; and

dropping the falling edge of the frame at one predetermined point in

the data structure to indicate a first data word and at a second predetermined point in the data

structure indicates a secondary set of data words.

8. (Original) The method of claim 7 wherein transmitting computer data signals

embodied in carrier waves from a transmitting device to a receiving device comprises

encoding the data structure with a predetermined number of data field bits.

9. (Original) The method of claim 7 wherein transmitting computer data signals

embodied in carrier waves from a transmitting device to a receiving device comprises

encoding the command structure with a predetermined number of command/control field

bits.

(Original) The method of claim 7 wherein transmitting computer data signals 10.

embodied in carrier waves from a transmitting device to a receiving device comprises

dropping the falling edge of the frame at one predetermined point in the control structure to

indicate a first command and at a second predetermined point in the control structure to

indicate a secondary set of commands.

(Currently Amended) The method of claim 7 wherein transmitting computer data 11.

signals embodied in carrier waves from a transmitting device to a receiving device

comprises:

dropping the falling edge of the frame at one predetermined point in the

control structure to indicate a first command word and at a second predetermined point in the

control structure to indicate a secondary set of command words; and

dropping the falling edge of the frame at one predetermined point in the data

structure to indicate a first data word and at a second predetermined point in the data

structure indicates a secondary set of data words, and wherein the secondary set of command

words is greater than the secondary set of data words.

12. (Canceled).

13. (Currently Amended) A computer data signal embodied in a carrier wave for

communicating between a first device and a second device, wherein the first and second

devices communicate with each other over a bus, the computer data signal comprising:

Examiner: Vaughn Jr., William C. 42P11014 Art Unit: 2143 - 4 -

a data structure embodied in a frame; and

at least one control structure embodied in the frame and preceding the data

structure; and

a clock structure embodied in the frame, wherein a rising edge of the frame

defines the clock structure, and wherein a falling edge of the frame is to indicate[[s]] that

what follows the falling edge of the frame is a data structure or a control structure,

wherein the falling edge of the frame occurring at one predetermined point in

the control structure indicates a first command word and the falling edge of the frame

occurring at a second predetermined point in the control structure indicates a secondary set of

command words, and wherein the falling edge of the frame occurring at one predetermined

point in the data structure indicates a first data word and the falling edge of the frame

occurring at a second predetermined point in the data structure indicates a secondary set of

data words.

(Original) The computer data signal of claim 13 wherein the data structure comprises 14.

a predetermined number of encoded data field bits.

(Original) The computer data signal of claim 13 wherein the command structure 15.

comprises a predetermined number of encoded command/control field bits.

16. (Original) The computer data signal of claim 13 wherein the falling edge of the frame

occurring at one predetermined point in the control structure indicates a first command and

the falling edge of the frame occurring at a second predetermined point in the control

structure indicates a secondary set of commands.

17. (Canceled).

18. (Currently Amended) The computer data signal of claim 13 wherein the falling edge

of the frame occurring at one predetermined point in the control structure indicates a first

command word and the falling edge of the frame occurring at a second predetermined point

in the control structure indicates a secondary set of command words, and wherein the falling

Examiner: Vaughn Jr., William C. 42P11014 - 5 -Art Unit: 2143

edge of the frame occurring at one predetermined point in the data structure indicates a first

data word and the falling edge of the frame occurring at a second predetermined point in the

data structure indicates a secondary set of data words, and wherein the secondary set of

command words is greater than the secondary set of data words.

(Currently Amended) A network, comprising: 19.

at least one transmitting device; and

at least one receiving device coupled to the transmitting device to exchange

frames, wherein each frame includes a data structure, at least one control structure, and a

clock structure, and wherein a rising edge of the frame is to indicate[[s]] the clock structure

and the falling edge of the frame is to indicate[[s]] that the structure that follows a falling

edge of the frame is the data structure or the command structure, and wherein any receiving

device is coupled to use the clock to adjust a phase of one or more of the frames to

synchronize the frames with each other,

wherein the falling edge of the frame occurring at one predetermined point in

the control structure indicates a first command word and the falling edge of the frame

occurring at a second predetermined point in the control structure indicates a secondary set of

command words, and wherein the falling edge of the frame occurring at one predetermined

point in the data structure indicates a first data word and the falling edge of the frame

occurring at a second predetermined point in the data structure indicates a secondary set of

data words.

20. (Original) The network of claim 19 wherein the data structure comprises a

predetermined number of encoded data field bits.

21. (Original) The network of claim 19 wherein the command structure comprises a

predetermined number of encoded command/control field bits.

22. (Original) The network of claim 19 wherein the falling edge of the frame occurring at

one predetermined point in the control structure indicates a first command and the falling

Examiner: Vaughn Jr., William C. 42P11014 Art Unit: 2143 - 6 -

edge of the frame occurring at a second predetermined point in the control structure indicates a secondary set of commands.

- 23. (Canceled).
- 24. (Currently Amended) The network of claim 19 wherein the falling edge of the frame occurring at one predetermined point in the control structure indicates a first command word and the falling edge of the frame occurring at a second predetermined point in the control structure indicates a secondary set of command words, and wherein the falling edge of the frame occurring at one predetermined point in the data structure indicates a first data word and the falling edge of the frame occurring at a second predetermined point in the data structure indicates a secondary set of data words, and wherein the secondary set of command words is greater than the secondary set of data words.
